

Greases

Grease is nothing but a oil mixed with a suitable thickener. The property of the grease therefore depends on the base oil that is used. ALL our greases are manufactured using synthetic base oils which have very high temperature withstanding capacities, superior lubrication properties and good E.P. properties.

Special instructions

While filling the grease precaution should be taken that only 3/4th of the bearing casing capacity is filled and the rest kept empty as greases have a tendency of expanding and over filling could lead to damage.
